
Optical Properties of Solids (2nd Revised edition)

By Mark Fox

Oxford University Press. Paperback. Book Condition: new. BRAND NEW, Optical Properties of Solids (2nd Revised edition), Mark Fox, The second edition of this successful textbook provides an up-to-date account of the optical physics of solid state materials. The basic principles of absorption, reflection, luminescence, and light scattering are covered for a wide range of materials, including insulators, semiconductors and metals. The text starts with a review of classical optics, and then moves on to the treatment of optical transition rates by quantum theory. In addition to the traditional discussion of crystalline materials, glasses and molecular solids are also covered. The first edition included a number of subjects that are not normally covered in standard texts, notably semiconductor quantum wells, molecular materials, vibronic solid state lasers, and nonlinear optics. The basic structure of the second edition is unchanged, but all of the chapters have been updated and improved. Futhermore, a number of important new topics have been added, including: * Optical control of spin * Quantum dots * Plasmonics * Negative refraction * Carbon nanostructures (graphene, nanotubes and fullerenes) * NV centres in diamond The text is aimed at final year undergraduates, masters students and researchers. It is mainly written for...

Reviews

I actually started looking over this publication. It really is rally interesting throgh studying period. Once you begin to read the book, it is extremely difficult to leave it before concluding.

Good electronic book and valuable one. It really is basic but unexpected situations in the 50 percent in the pdf. You wont really feel monotony at at any moment of your time (that's what catalogues are for concerning when you ask me).
